Photosynthesis notes

Note 1: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 2: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 3: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 4: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 5: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 6: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 7: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 8: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 9: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 10: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 11: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.

Note 12: the Calvin cycle fixes carbon dioxide using ATP and NADPH made in the light reactions.
